TITLE OF INVENTION

Circuit for Carrying out Secured Data Transmission, Especially in Ring Systems

APPLICANT(S) FOR DO/EO/US

Meyer-Gräfe et al

Applicant herewith submits to the United States Designated/Elected Office (DO/EO/US) the following items and other information:

1. ☒ This is a **FIRST** submission of items concerning a filing under 35 U.S.C. 371.
2. ☐ This is a **SECOND** or **SUBSEQUENT** submission of items concerning a filing under 35 U.S.C. 371.
3. ☐ This is an express request to begin national examination procedures (35 U.S.C. 371(f)). The submission must include items (5), (6), (9) and (24) indicated below.
4. ☒ The US has been elected by the expiration of 19 months from the priority date (Article 31).
5. ☒ A copy of the International Application as filed (35 U.S.C. 371 (c) (2))
 - a. ☐ is attached hereto (required only if not communicated by the International Bureau).
 - b. ☒ has been communicated by the International Bureau.
 - c. ☐ is not required, as the application was filed in the United States Receiving Office (RO/US).
6. ☒ An English language translation of the International Application as filed (35 U.S.C. 371(c)(2)).
 - a. ☒ is attached hereto.
 - b. ☐ has been previously submitted under 35 U.S.C. 154(d)(4).
7. ☐ Amendments to the claims of the International Application under PCT Article 19 (35 U.S.C. 371 (c)(3))
 - a. ☐ are attached hereto (required only if not communicated by the International Bureau).
 - b. ☐ have been communicated by the International Bureau.
 - c. ☐ have not been made; however, the time limit for making such amendments has NOT expired.
 - d. ☐ have not been made and will not be made.
8. ☐ An English language translation of the amendments to the claims under PCT Article 19 (35 U.S.C. 371(c)(3)).
9. ☒ An oath or declaration of the inventor(s) (35 U.S.C. 371 (c)(4)). **UNEXECUTED**
10. ☒ An English language translation of the annexes to the International Preliminary Examination Report under PCT Article 36 (35 U.S.C. 371 (c)(5)).
11. ☒ A copy of the International Preliminary Examination Report (PCT/IPEA/409).
12. ☒ A copy of the International Search Report (PCT/ISA/210).

Items 13 to 20 below concern document(s) or information included:

13. ☒ An Information Disclosure Statement under 37 CFR 1.97 and 1.98.
14. ☐ An assignment document for recording. A separate cover sheet in compliance with 37 CFR 3.28 and 3.31 is included.
15. ☒ A **FIRST** preliminary amendment.
16. ☐ A **SECOND** or **SUBSEQUENT** preliminary amendment.
17. ☐ A substitute specification.
18. ☐ A change of power of attorney and/or address letter.
19. ☐ A computer-readable form of the sequence listing in accordance with PCT Rule 13ter.2 and 35 U.S.C. 1.821 - 1.825.
20. ☐ A second copy of the published international application under 35 U.S.C. 154(d)(4).
21. ☐ A second copy of the English language translation of the international application under 35 U.S.C. 154(d)(4).
22. ☒ Certificate of Mailing by Express Mail
23. ☒ Other items or information:

Zur Erklärung der Zweibuchstaben-Codes, und der anderen Abkürzungen wird auf die Erklärungen ("Guidance Notes on Codes and Abbreviations") am Anfang jeder regulären Ausgabe der PCT-Gazette verwiesen.

(57) Zusammenfassung: Die vorliegende Schaltungsanordnung erlaubt es, an ringförmigen Standardbussystemen Daten zu übertragen, die für den Aufbau fehlertoleranter Strukturen notwendig sind. Zur Realisierung benötigt man eine Überwachungseinheit und dezentrale Ein- und Ausgabeeinheiten, die Daten zur Regelung oder Steuerung senden oder entgegennehmen. Die Schaltungsanordnung übernimmt die Aufgabe, eventuelle Fehler zu erkennen, die für den Prozess innerhalb einer Maschine oder Anlage zur Gefahr werden können. Durch den internen Aufbau identifiziert die Schaltungsanordnung bereits vor der Fehleroffenbarung zum Prozess einen eventuellen Fehler und leitet eine gesicherte Abschaltung ein. Dabei ist es gleichgültig, ob die externe Steuerung oder das verwendete Bussystem für den Fehler verantwortlich ist.

English Translation of the Annexes to the International Preliminary Examination Report

Circuit arrangement for protected data transmission, particularly in ring-shaped bus systems

5 Description

The invention relates to a circuit arrangement for protected data transmission, particularly in ring-shaped bus systems.

In machine and plant construction today, movements and processes are not infrequently controlled which represent a danger to the life and health of persons, particularly the operating personnel, in the case of a fault or if they fail. Apart from these dangers, however, valuable machine parts must also be protected which can suffer great financial damage in the case of possible malfunctions.

Any faults which may occur must, therefore, be recognized by the process or the existing control facilities and the machine should always be driven in a state which can be considered safe. As a rule, redundant structures are necessary for this which monitor the safety functions independently of the actual control. In machine or plant construction, detection of a single error is frequently sufficient for fault detection. After this fault has been detected, the control process can then be interrupted and stay in a safe state. This prevents any damage by faulty continuation of the process.

The methods for fault detection and the measures necessary for these are stated in international standards DIN V VDE 0801 and DIN ISO 61508. By means of the principles given in these standards, the manufacturers of automation equipment have developed in recent years different strategies which allow safe transmissions on bus systems, see, for example, the

“profibus with F-Profil, PNO and safety-bus P by Pilz and Sick.

In addition, control systems will reach the market which already have internally redundant structures and thus, in interplay with said safe bus systems, allow fault detection; see, for example, the bus systems from Siemens, particularly the equipment series S 7 400 F, or the PSS 3000 series by Pilz.

However, the methods implemented there can only be used with completely new installation of the necessary components and protect only inadequately against systematic faults.

Instead, the invention has the object of detecting faults in a process which is only built up with standard units.

In addition, it should preferably be not only any faults occurring in the transport of data via a bus system used, but also disturbances or programming errors in the control device which are detected and eliminated.

The circuit arrangement thus represents an implementation of a method which has already been filed under the post-published patent no. 198 57 683.8, the full extent of the content of which is also made the subject matter of the present patent application by reference.

The method is particularly suitable for all ring-shaped bus systems, the technology described being optimally adapted for the interbus standard. In this case, a requirement profile was already worked out at the beginning of 1999 and then published, IEE journal, April 1999, Karsten Meyer-Gräfe: “Interbus goes Safety”.

In the text which follows, the invention is described in more detail, referring to preferred embodiments and the attached drawings, in which:

Fig. 1 shows the configuration for a first embodiment of a system for protected data transmission,

Fig. 2 shows the internal configuration of the peripheral safety-related unit of the system for protected data transmission.

In the text which follows, the invention will be described in greater detail, initially by referring to Fig. 1. Fig. 1 shows a suitable configuration for such a system.

5 The control unit (1) handles all control functions in the process as is known, for example, from the conventional interbus system. The control unit (1) also detects possible faults and can interrupt processes or bring them to a safe state.

10 In the case of its own failure or in the case of faulty data transport, however, the control unit (1) is conventionally not able to produce the desired safe state. This failure also occurs, for example, if there is extensive separation between process control and safety control in the control system. Since there is conventionally no redundancy here, either, an undetected fault may have grave consequences.

15 According to the invention, other components are added which detect and eliminate a possible fault. These units are: a peripheral monitoring unit (4) and one or more peripheral safety-related units (9) in the process, which are only necessary where safety-related data are received or transmitted.

The control unit (1) contains a data map register (2) which sends all output data and other checking signals via the data line (13) to the peripheral units (7, 8, 12, peripheral safety-related unit 9 and peripheral monitoring unit 4).

20 Since the bus transport works in a similar way to a shift register, all peripheral units send their input data to the control unit in the same bus cycle via the return line (14) and these data are available in the data map register (3). In a subsequent SPC (stored-program control) cycle, the SPC then processes the data from its two map registers (2, 3) and thus generates the necessary

state for the process.

Without the peripheral monitoring unit (4) and the peripheral safety-related unit (9), however, the SPC is not capable of controlling a programming error, a state due to disturbance or failure or a data error due to the wrong bus transport. The peripheral monitoring unit (4), therefore, contains its own microprocessor which monitors the transmitted data of the SPC and only examines the safety-related quantities for appropriateness, particularly their correctness.

Thus, the peripheral monitoring unit (4) with the transfer unit (5) is capable of monitoring the SPC. However, the peripheral monitoring unit (4) can also additionally read the data of the inputs of the peripheral units via the transfer unit (6) installed in the return path. Since the peripheral safety-related unit (9) also forwards its output information (D3) directly to the input section of the bus unit (23), it is possible to check directly whether the bus transfer has worked correctly.

Furthermore, the peripheral monitoring unit (4) with its transfer unit (5) is also capable of manipulating the data for the peripheral safety-related unit (9). In particular, the peripheral monitoring unit (4) can overwrite data of the SPC and thus prevent agreement with the data output from the peripheral safety-related unit (9). The peripheral safety-related unit (9) becomes active only if it has received an agreement for the data of the output unit (10) via the checking unit (11).

The timing with the data transport is shown in the following table:

S	MT	ST		1		2		D3		C3		4		SR		MR
h		A	E	A	E	A	E	A	E	A	E	A	E	A	E	
0	LB W		ST		E1		E2		E3		EC 3		E4		ES R	
1	AS R	LB W	LB w	ST	ST	E1	E1	E2	E2	E3	E3	EC 3	EC 3	E4	E4	ES R
2	A4	AS R	AS R	LB w	LB W	ST	ST	E1	E1	E2	E2	E3	E3	EC 3	EC 3	E4
3	1	A4	A4	AS R	AS R	LB W	LB W	ST	ST	E1	E1	E2	E2	E3	E3	EC 3
4	A3	1	AC 3	A4	A4	AS R	AS R	LB W	LB W	ST	ST	E1	E1	E2	E2	E3
5	A2	A3	A3	A C 3	AC 3	A4	A4	AS R	AS R	LB W	LB W	ST	ST	E1	E1	E2
6	A1	A2	A2	A3	A3	AC 3	AC 3	A4	A4	AS R	AS R	LB W	LB W	ST	ST	E1
7	ST	A1	A1	A2	A2	A3	A3	AC 3	AC 3	A4	A4	AS R	AS R	LB W	LB W	ST
8		ST	ST	A1	A1	A2	A2	A3	A3	AC 3	AC 3	A4	A4	AS R	AS R	LB W

The timing diagram shows the state after each shift information in the ring by means of a preferred example, the Interbus system by Phoenix Contact GmbH and Co. KG.

The information AC3 can be manipulated by the peripheral monitoring unit (4) with the transfer unit (5) and can be overwritten. The peripheral safety-related unit (9) thus receives in its checking logic (11) an additional information item which prevents a faulty output.

As can also be seen from the timing diagram, the peripheral monitoring unit (4) can also read the data of the output from the peripheral safety-related unit (9) (EC3). These data represent the direct output information of the peripheral safety-related unit (9) so that a bus error is reliably detected.

The internal configuration of the peripheral safety-related unit (9) is shown in figure 2.

The peripheral safety-related unit (9) consists of two bus units (22, 23) so that input information can be fetched redundantly (24, 25). In addition, the output information Dn from a bus unit (22) is mapped via the input section of the other bus unit (23). A possible error in the internal storage or during the bus transport is thus detected in the subsequent cycle of the bus transport. The output information Dn is written into the buffer (7) by the control unit (SPC).

However, the checking logic (11) additionally decides whether the information of the buffer (7) appears at the peripheral unit via the output logic (28). This checking logic (11) can either release the stored information via the line (30) or delete the state via the line (31) so that the output (29) brings the control process into a safe state.

In principle, however, the circuit arrangement operates in many areas just like a normal decentralized SPC system. The components merely additionally allow inputs to be redundantly

monitored and stored output information to be examined for appropriateness, particularly freedom from faults before it is output. Furthermore, the monitoring unit can also detect faults which have not only been produced by failure or disturbance but were caused by an error in programming or parameterizing.

5 The present circuit arrangement thus allows data which are necessary for configuring fault-tolerant structures to be transmitted on standard ring-shaped bus systems.

To implement the invention, a monitoring unit and peripheral input and output units transmitting or receiving data for control purposes are used.

10 The circuit arrangement handles the task of detecting any faults which can become a danger for the control process, particularly for the transmission of control, sensor or actuator data, within a machine or plant. Due to its internal configuration, the circuit arrangement identifies a possible error even before the error is transmitted to the control process and initiates a protected switch-off. In this arrangement, it is of no importance whether it is the external control unit or the bus system used which is responsible for the error.

15

Claims

1. A system for protected data transmission in

ring-shaped bus systems, comprising

- a control unit (1) which sends output data and

checking signals for a control process to peripheral units (4, 7, 8, 9, 12),

- a peripheral monitoring unit (4) which has

a first transfer unit (5) for monitoring the transmitted data and a second transfer unit (6)

for monitoring data to be read back into the control unit (1), and

- at least one peripheral safety-related unit (9)

for receiving or transmitting safety-related data, in which data are temporarily stored for output, which has a checking logic (11) for monitoring the temporarily stored data and an output unit (10) for outputting the temporarily stored data,

the temporarily stored data being monitored by the

checking logic (11) in such a manner that, in the case of a fault, a safe state of the output unit (10) for the control process is initiated,

the first transfer unit (5) monitoring the data

sent out by the control unit (1), in such a manner that, in the case of a fault, release data for the peripheral safety-related unit (9) are suppressed or deleted so that the faulty data

do not reach the control process, particularly data transmission sequences, wherein the input data of the peripheral safety-related unit (9) and its temporarily stored data are read back via the second transfer unit (6).

2. The system as claimed in claim 1,
characterized in that
the temporarily stored data and the input data of
the peripheral safety-related unit (9) are provided to the peripheral monitoring unit (4).

3. The system as claimed in claim 1 or 2,
characterized in that
the peripheral safety-related unit (9) reads back
the temporarily stored data via a bus unit (23).

4. The system as claimed in claims 1 to 3,
characterized in that
the peripheral safety-related unit (9) has a buffer
(27) which is read back by a bus unit (23) and is thus checked by the peripheral
monitoring unit (4) even before release to the control process, particularly of data
transmitted via the bus, via the output logic (28) with the output signal (29).

5. The system as claimed in claims 3 or 4,
characterized in that
the peripheral safety-related unit (9) comprises a
further bus unit (22) so that the peripheral safety-related unit (9) has redundant input
channels (24, 25) and thus redundantly monitors the connected control process and can
detect a fault.

6. The system as claimed in claims 1 to 5,
characterized in that
the checking logic (11) decides whether the data
stored in the buffer (27) are output via the output logic (28).

7. The system as claimed in claims 1 to 6,
characterized in that
the checking logic (11) releases or deletes the
temporarily stored data.

8. The system as claimed in claims 1 to 7,
characterized in that
the peripheral monitoring unit (4) with the first
transfer unit (5) is capable of manipulating the data for the peripheral safety-related unit
(9).

9. The system as claimed in claims 1 to 8,
characterized in that
the peripheral monitoring unit (4) overwrites data
of the SPC.

10. The system as claimed in claim 1 to 9,

characterized in that

the agreement to a data output from the peripheral
safety-related unit (9) is prevented by the overwriting of the data.

5 11. The system as claimed in claim 1 to 10,

 characterized in that

 the checking logic (11) receives from the

peripheral monitoring unit (4) an information item which prevents a faulty output.

10 12. The system as claimed in claims 1 to 11,

 characterized in that

 the peripheral safety-related unit (9) only becomes

active if it has received an agreement for the data of the output unit (10) via the checking
unit (11).

15 13. The system as claimed in claims 1 to 12,

 characterized in that

 the peripheral units (4, 7, 8, 9, 12) themselves

can perform logic operations and thus a higher process speed is achieved in the overall
20 combined operation.

 14. The system as claimed in claims 1 to 13,

 characterized in that

the peripheral monitoring unit (4) itself handles
control functions and thus a combined operation with a safety control unit is produced.

5 15. The system as claimed in claims 1 to 14,
characterized in that
the peripheral safety-related unit (9) manages with
standard non-safety-related modules for the bus traffic and does not need any special
safety-related modules.

10 16. The system as claimed in claims 1 to 15,
characterized in that
the function is operable in standard bus systems
and is capable of operating without additional installation of further bus systems or
special components.

15 17. The system as claimed in claims 1 to 16,
characterized in that
the function can be installed subsequently by
adding the peripheral monitoring unit (4) and exchanging normal peripheral units for
20 peripheral safety-related units (9).

18. The system as claimed in claims 1 to 17,
characterized in that

the safety function of the system can also be
subsequently expanded by adding hardware elements or software modules.

19. The system for protected data transmission,
particularly in ring-shaped bus systems,

in which a peripheral monitoring unit (4) checks
the data sent out by a control unit (1) and examines them for faults and in the case of a
fault suppresses or deletes release data for a peripheral safety-related unit (9) so that a
fault cannot reach the control process, particularly not data transmission sequences.

20. The system as claimed in claim 19,
in which temporarily stored data of the peripheral
safety-related unit (9) are read via a bus unit (23) and are monitored and detected by a
checking logic (11).

21. The system as claimed in claim 19 or 20,
in which a safe state of data transmission,
particularly of the output unit (10), is initiated by the checking logic (11).

22. A peripheral safety-related unit in a system for
protected data transmission in ring-shaped bus systems,
comprising
- two bus units (22, 23), to forward the output

data of a bus unit (22) also to the input section of the other bus unit (23) in order to be able to fetch information from the control process via redundant input channels (24, 25) and in order to provide the output data of a peripheral monitoring unit (4) for read-back,

- a buffer (27) in which the output data are stored

before their release,

- an output logic (28) via which the temporarily

stored data are output, and

- a checking logic (11) which decides whether the

data stored in the buffer (27) are output via the output logic (28).

23. The peripheral safety-related unit as claimed in claim 20,

characterized in that

the checking logic (11) releases or deletes the

temporarily stored data.

24. The peripheral safety-related unit as claimed in claims 22 or 23,

characterized in that

the checking logic (11) receives information from

the peripheral monitoring unit (4) in order to be able to prevent a faulty output by this means.

Abstract

The present circuit arrangement allows data, which are necessary for building up fault-tolerant structures, to be transmitted on standard ring-shaped bus systems. Its implementation requires a monitoring unit and input and output units which transmit or receive data for control.

5 The circuit arrangement handles the task of detecting any faults which can become a danger for the process within a machine or plant. Due to its internal configuration, the circuit arrangement identifies any fault even before the detection of the fault and initiates a protected switch-off. In this arrangement, it is of no importance whether it is the external control unit or the bus system used which is responsible for the fault.

APPLICANT(S) FOR DO/EO/US

Meyer-Grafe

Applicant herewith submits to the United States Designated/Elected Office (DO/EO/US) the following items and other information:

1. ☐ This is a **FIRST** submission of items concerning a filing under 35 U.S.C. 371.
2. ☒ This is a **SECOND** or **SUBSEQUENT** submission of items concerning a filing under 35 U.S.C. 371.
3. ☐ This is an express request to begin national examination procedures (35 U.S.C. 371(f)). The submission must include items (5), (6), (9) and (24) indicated below.
4. ☐ The US has been elected by the expiration of 19 months from the priority date (Article 31).
5. ☐ A copy of the International Application as filed (35 U.S.C. 371 (c) (2))
 - a. ☐ is attached hereto (required only if not communicated by the International Bureau).
 - b. ☐ has been communicated by the International Bureau.
 - c. ☐ is not required, as the application was filed in the United States Receiving Office (RO/US).
6. ☐ An English language translation of the International Application as filed (35 U.S.C. 371(c)(2)).
 - a. ☐ is attached hereto.
 - b. ☐ has been previously submitted under 35 U.S.C. 154(d)(4).
7. ☐ Amendments to the claims of the International Application under PCT Article 19 (35 U.S.C. 371 (c)(3))
 - a. ☐ are attached hereto (required only if not communicated by the International Bureau).
 - b. ☐ have been communicated by the International Bureau.
 - c. ☐ have not been made; however, the time limit for making such amendments has NOT expired.
 - d. ☐ have not been made and will not be made.
8. ☐ An English language translation of the amendments to the claims under PCT Article 19 (35 U.S.C. 371(c)(3)).
9. ☒ An oath or declaration of the inventor(s) (35 U.S.C. 371 (c)(4)).
10. ☐ An English language translation of the annexes to the International Preliminary Examination Report under PCT Article 36 (35 U.S.C. 371 (c)(5)).
11. ☐ A copy of the International Preliminary Examination Report (PCT/IPEA/409).
12. ☐ A copy of the International Search Report (PCT/ISA/210).

Items 13 to 20 below concern document(s) or information included:

13. ☐ An Information Disclosure Statement under 37 CFR 1.97 and 1.98.
14. ☒ An assignment document for recording. A separate cover sheet in compliance with 37 CFR 3.28 and 3.31 is included.
15. ☐ A **FIRST** preliminary amendment.
16. ☐ A **SECOND** or **SUBSEQUENT** preliminary amendment.
17. ☐ A substitute specification.
18. ☐ A change of power of attorney and/or address letter.
19. ☐ A computer-readable form of the sequence listing in accordance with PCT Rule 13ter.2 and 35 U.S.C. 1.821 - 1.825.
20. ☐ A second copy of the published international application under 35 U.S.C. 154(d)(4).
21. ☐ A second copy of the English language translation of the international application under 35 U.S.C. 154(d)(4).
22. ☐ Certificate of Mailing by Express Mail
23. ☒ Other items or information:

First Class Mail Certification
